

FOR IMMEDIATE RELEASE

ISGN's LSAMS Servicing System Now Features Web-Based Application

New LSAMS web-based feature gives servicers the ability to use ISGN as their hosting solution to manage end of day processing and system updates, lowering servicers' IT staff costs

BENSALEM, PA — February 22, 2011 — ISGN, a leading provider of end-to-end technology solutions and services to the U.S. mortgage industry, announces that its LSAMS servicing system now features a web-based application solution, converting servicers' host screens into a new web look and feel. It gives servicers the tools to quickly and easily extend their legacy applications to the web, as they become available as hypertext markup language (HTML) through web browsers. Servicers can improve the workflow and navigation of their host applications without any access or modification to their source code.

LSAMS is a highly dynamic loan servicing system, with processing features that manage new loan boarding, transaction processing and banking, as well as investor accounting, collections and payoffs and other servicing-related tasks. The system gives servicers access to current customer data through a single servicing platform.

Servicers today find that they must employ additional information technology staff to work the odd hours required to ensure that their end of the day operational functions have been performed without any problematic issues flaring up. The LSAMS web-based application gives servicers the ability to pick ISGN as their hosting solution, letting ISGN manage the nightly end of day processing and perform any required system updates, allowing servicers to cut back their IT staff performing these operations.

The LSAMS web-based application provides users with many additional benefits, including rollover menu selections, buttons for function keys, dropdown boxes for sub-file selections, calendar widgets for date input fields and a new screen combination feature to consolidate inquiry screens. It also has a magnifying glass icon for F4 prompt fields.

"Servicers face a growing catalogue of cost pressures as they handle the challenges posed by layers of federal and state regulations, changing servicing guidelines and investor requirements," said Niraj Patel, group president of ISGN. "The new LSAMS web-based application will help servicers lower their IT costs as ISGN becomes a hosting solution, and enjoy improved workflow and navigation generated by a more technologically savvy and efficient servicing system."

About ISGN

ISGN Corporation is one of the largest providers of services and technology for the mortgage industry. An industry leader with more than 1,100 customers, including large global banks and many of the top ten lenders in the country, ISGN's product line includes a complete range of origination and settlement services, including origination, servicing and default platforms; broker price opinions; closing and settlement services; title, valuation and flood; as well as core servicing components and loss mitigation services. The company is based in Bensalem, Pennsylvania, and employs over 1,700 people across its eight domestic centers and two international facilities.

ISGN is funded by NEA Partners and the KK Birla Group. For more information, visit www.ISGN.com.
